

Uber Find My Ride Evidence Manifest

App details, screenshots, online survey evidence, internet research, analysis, and explicit limitations.

Method deviation: the required 10 synchronous in-depth interviews were not completed. The primary research is an online self-serve survey and is presented as directional evidence, not as interview completion.

1. Evidence base

62

unique submissions after
one confirmed duplicate
was removed

24 / 51

recent four-wheel users
reporting difficulty

33 / 29

Hyderabad / other-city
responses

4

driver responses — major
evidence gap

Research method

A mobile-first online survey with rider and driver branches, a consent gate, optional qualitative prompts, and structured tags for problem type, location, action, delay, recovery, and recurrence.

Live app: <https://praveenveera.github.io/uber-pickup-survey/>

Controls applied

- Confirmed duplicate R032 excluded from final analysis.
- Contact details and raw API payload excluded.
- Participant references reduced to anonymous response IDs.
- Counts distinguish 51 recent four-wheel users from 62 total unique responses.
- Multi-select counts are treated as mentions, not unique people.

Critical limitations

- No live follow-up probing; answer depth varies.
- Four narrative prompts were optional in the live interface.
- Only four responses came from drivers.
- Twenty-nine responses came from other cities, so this is not a Hyderabad-only sample.
- Consent was required in the interface but not stored as a separate backend response field.
- No reliable Hyderabad trip-volume or issue-rate denominator was found.

Your Uber pickup experience

This is Praveen Veera's academic assignment for a product management course — not run by or affiliated with Uber. Your answers will help Praveen solve a real assignment problem: understanding why finding your driver or rider after a booking can be confusing. Takes about 5 minutes. Your answers are anonymous unless you choose to leave contact details at the end.

I agree that my anonymous answers may be used as

☒ research quotes in Praveen's academic assignment. My name will not be published.

4. Recovery evidence

Pickup Story

ENTEHI

14 / 17

What finally helped, if anything? (choose all that apply)

☐ Calling or messaging each other

☐ Walking to a shared landmark

☐ Driver moved closer to me

☐ Security or staff helped

☐ Nothing helped — had to cancel

☐ Something else

Back

Next

Question: what finally helped?

Observed recovery pattern

Action	Mentions
Called	17
Waited	9
Moved	8
Messaged	5
Cancelled	4

Calling or messaging was reported as helpful in 20 of 28 issue cases, while 6 of 28 said nothing helped.

5. Top 10 insight traceability

#	Insight	Evidence	Strength
1	Difficulty is meaningful, not universal	24/51 recent users; 34/62 reported no issue	Strong, directional
2	For affected respondents, the problem often recurs	23/28 issue cases reported prior occurrence	Strong within subgroup
3	Complex environments concentrate problems	Airport 10; residential 7; mall 6; office 6	Strong pattern
4	Arrived does not mean rider and driver can meet	Wrong-pin and similar-gate reports; one detailed cross-road case	Moderate
5	Calling and messaging are the main recovery layer	Calling 17; messaging 5; helpful in 20/28 cases	Strong
6	The rider often absorbs recovery effort	Waited 9; moved 8; driver moved helped 3	Moderate–strong
7	Failures can create material delay	7/10 time-tagged cases exceeded five minutes	Moderate
8	Cancellation is multi-causal	Location overlaps with destination, fare, payment, and rain	Moderate
9	Some respondents found no effective recovery	6/28 selected nothing helped	Moderate
10	Finding the ride includes vehicle identification	One vehicle-number mismatch report	Weak edge case

Interpretation boundary: 23 of 28 means the issue happened before; it does not prove recurrence at the same venue. Sample percentages are not Hyderabad prevalence.

Insight-Traceability.md

Excluded: participant contact details, raw API payload, mixed-schema source workbook, test rows, local transcription artifacts, old submission drafts, temporary build files, and the raw internet workbook containing public creator contacts. Curated reports and the source register remain included.

Submission gate

The presenter-visible video and working link remain pending. Record under five minutes, upload, enable evaluator access, and add the link before submission.

This manifest documents evidence packaging and limitations; it does not convert the online survey into interview completion.
